

Rekonstruktion pleistozäner Uferlinien des Lake Manyara (Tanzania) mittels Fernerkundung

Felix Bachofer, Geraldine Quénéhervé, Michael Märker, Volker Hochschild

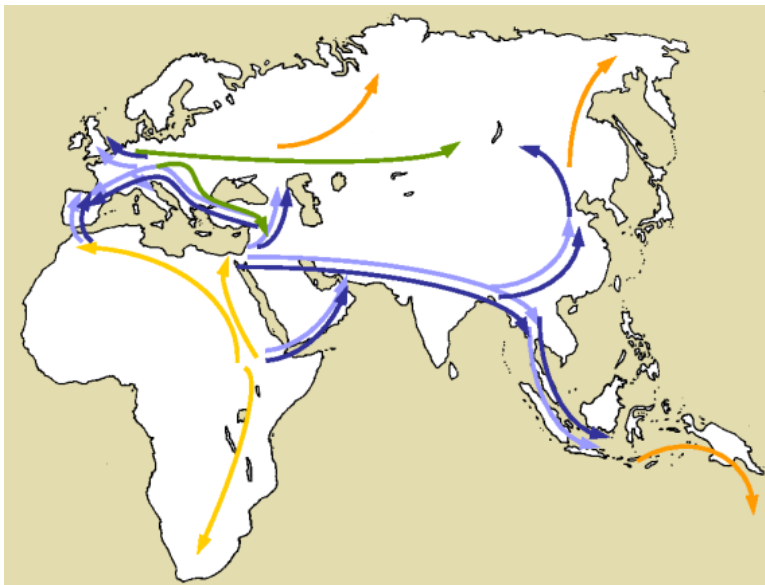

Department of Geography

The ROCEEH project

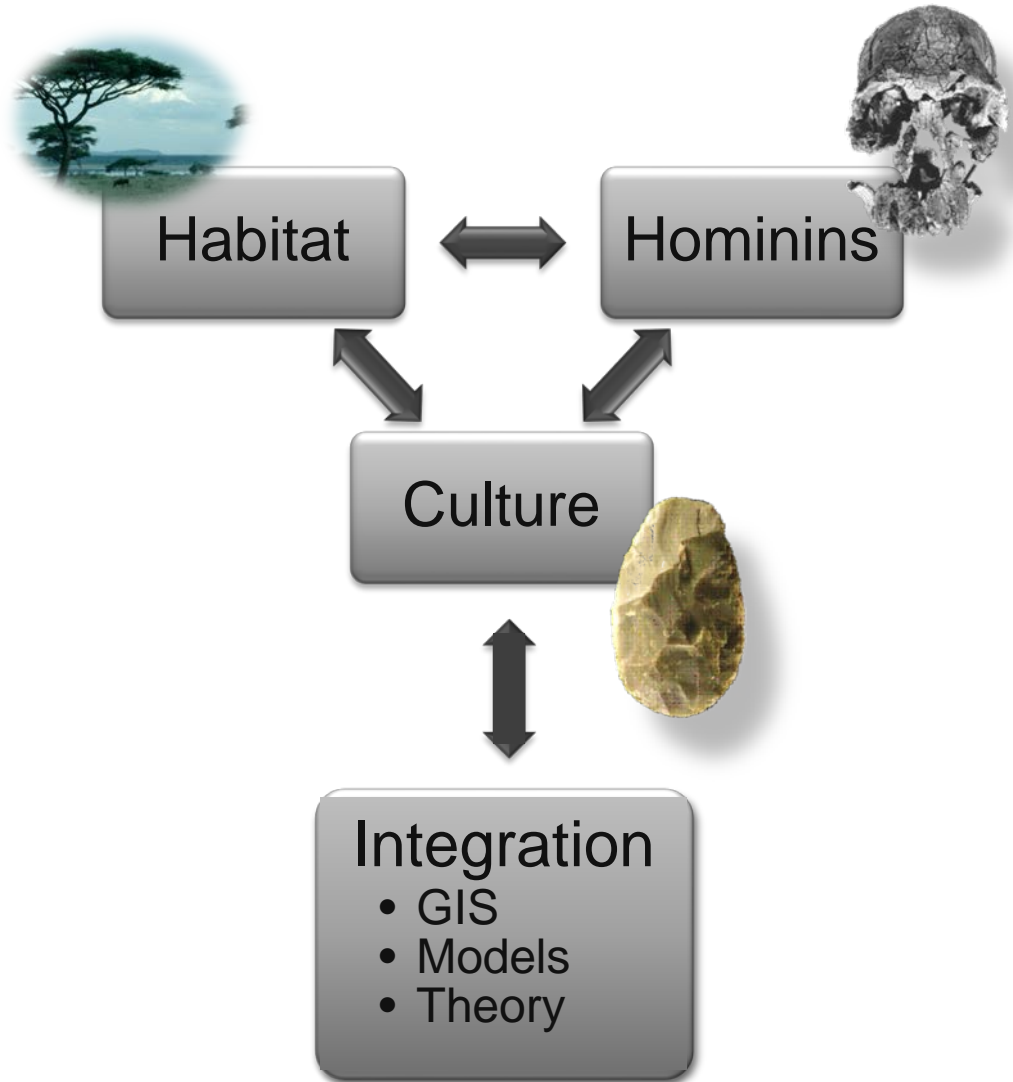

Spatial expansion:

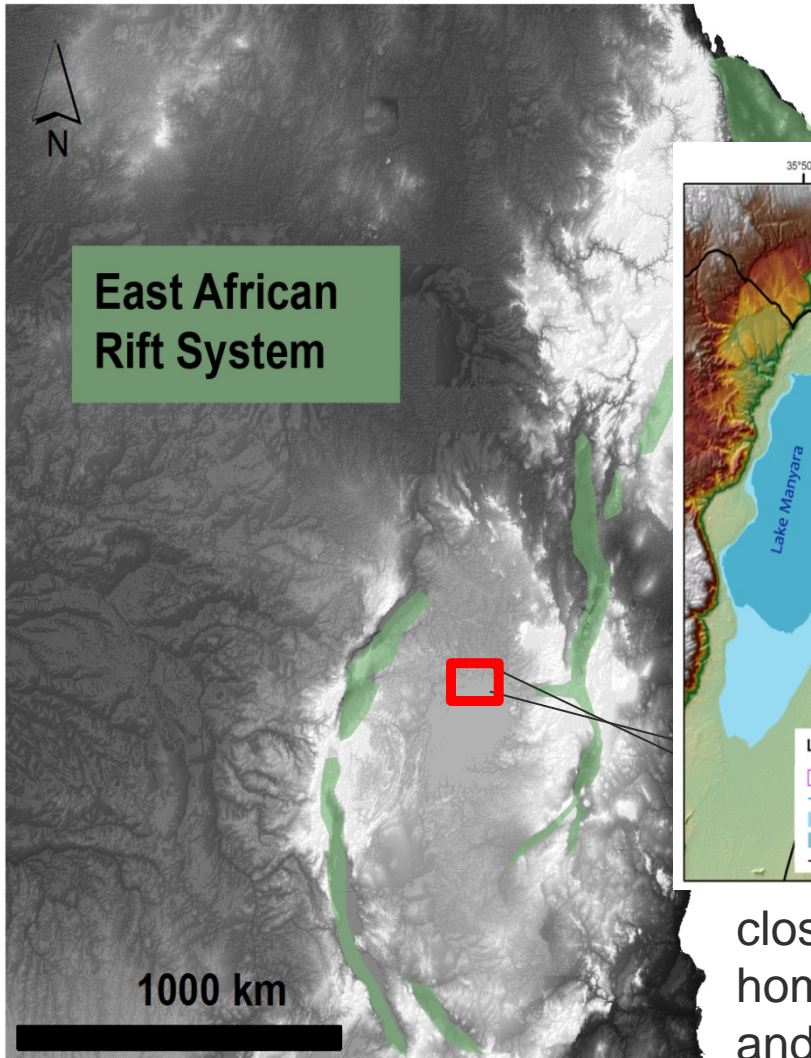

- of habitats
- of organisms
- of artefacts

Expansion of behavioral potential:

- biological
- cognitive
- cultural

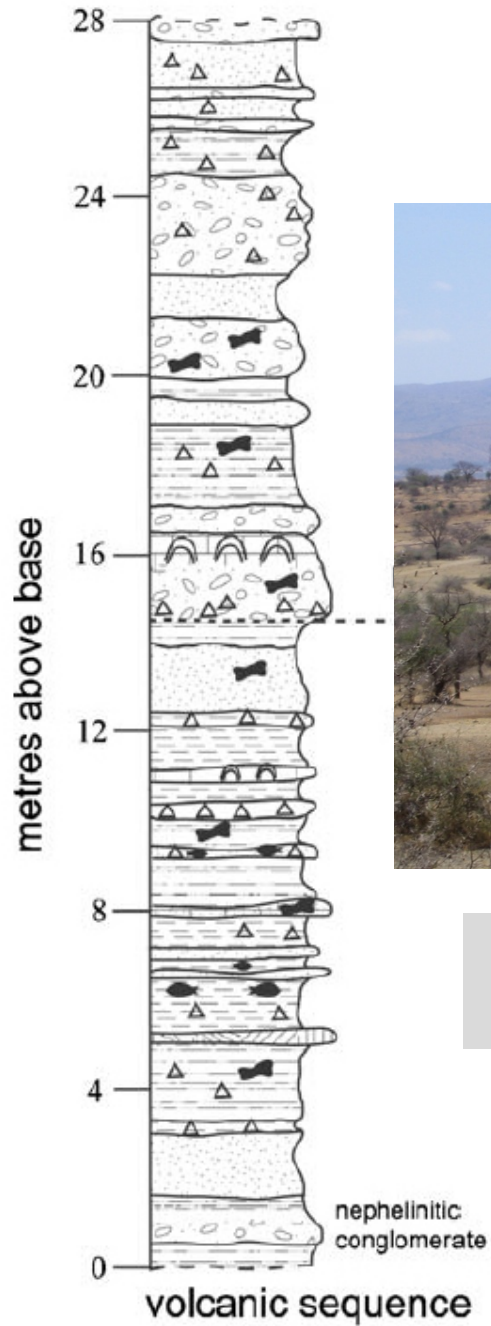

close to the village of Makuyuni, two hominin-bearing sites (0.63 and 0.78 Ma) and lots of vertebrate fossils and handaxes from different periods were found

Existing datings from published literature

Authors	Methods	Age / years
Casanova & Hillaire-Marcel 1992	C14 and U/Th (stromatolites)	Ca. 25,000
Casanova & Hillaire-Marcel 1992	C14 and U/Th (stromatolites)	Ca. 90,000
Schwartz et al. 2012	$^{40}\text{Ar}/^{39}\text{Ar}$ (tuffs)	Ca. 633,000

MANYARA BEDS

MANYARA BEDS

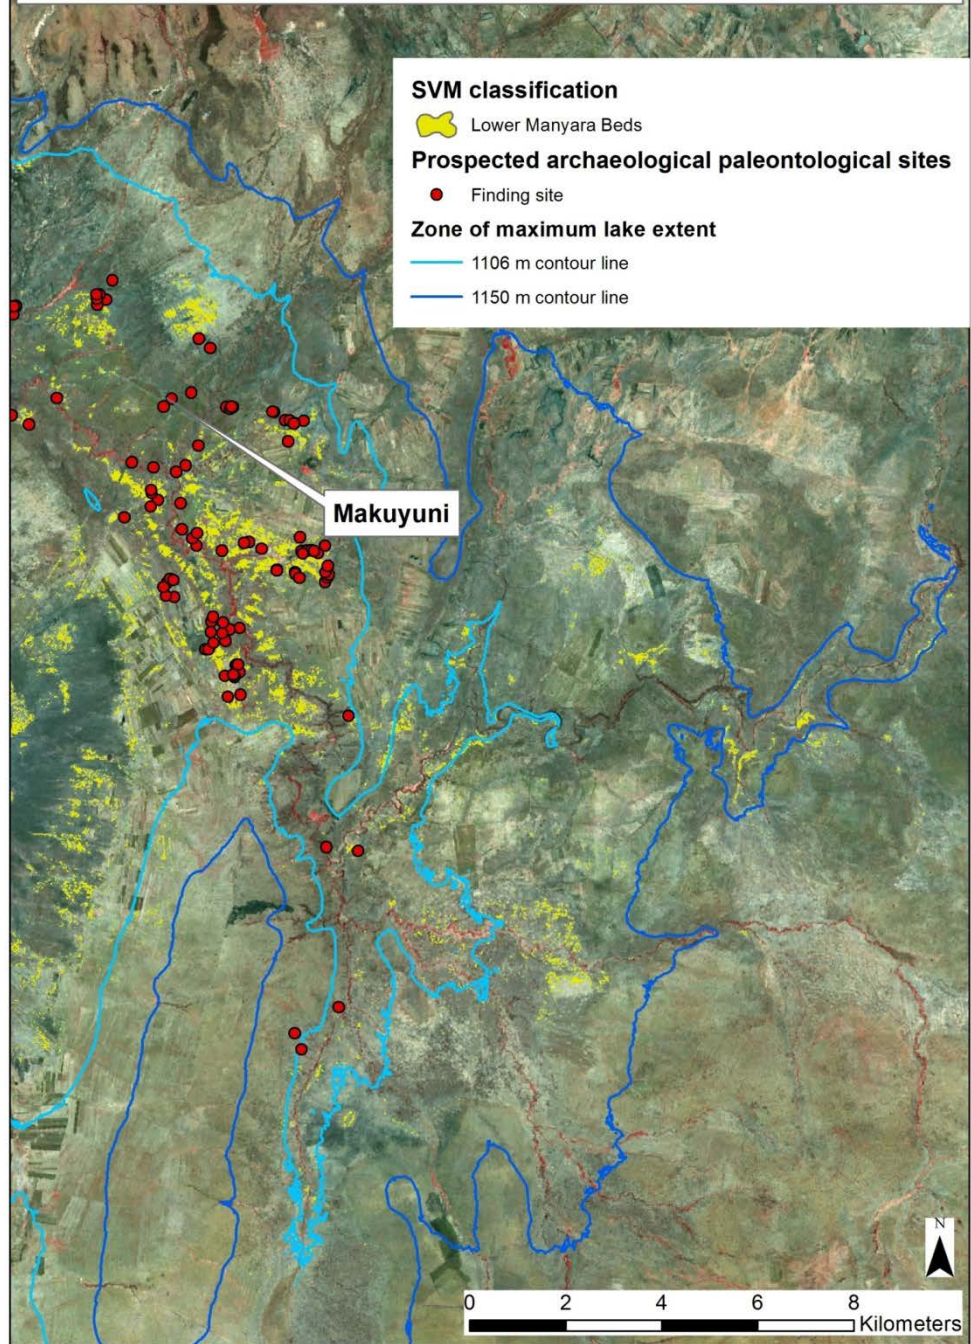

Landcover classification based on WorldView-2 image from 2010-10-15.

N

SVM classification of Lower Manyara Beds with ASTER imagery

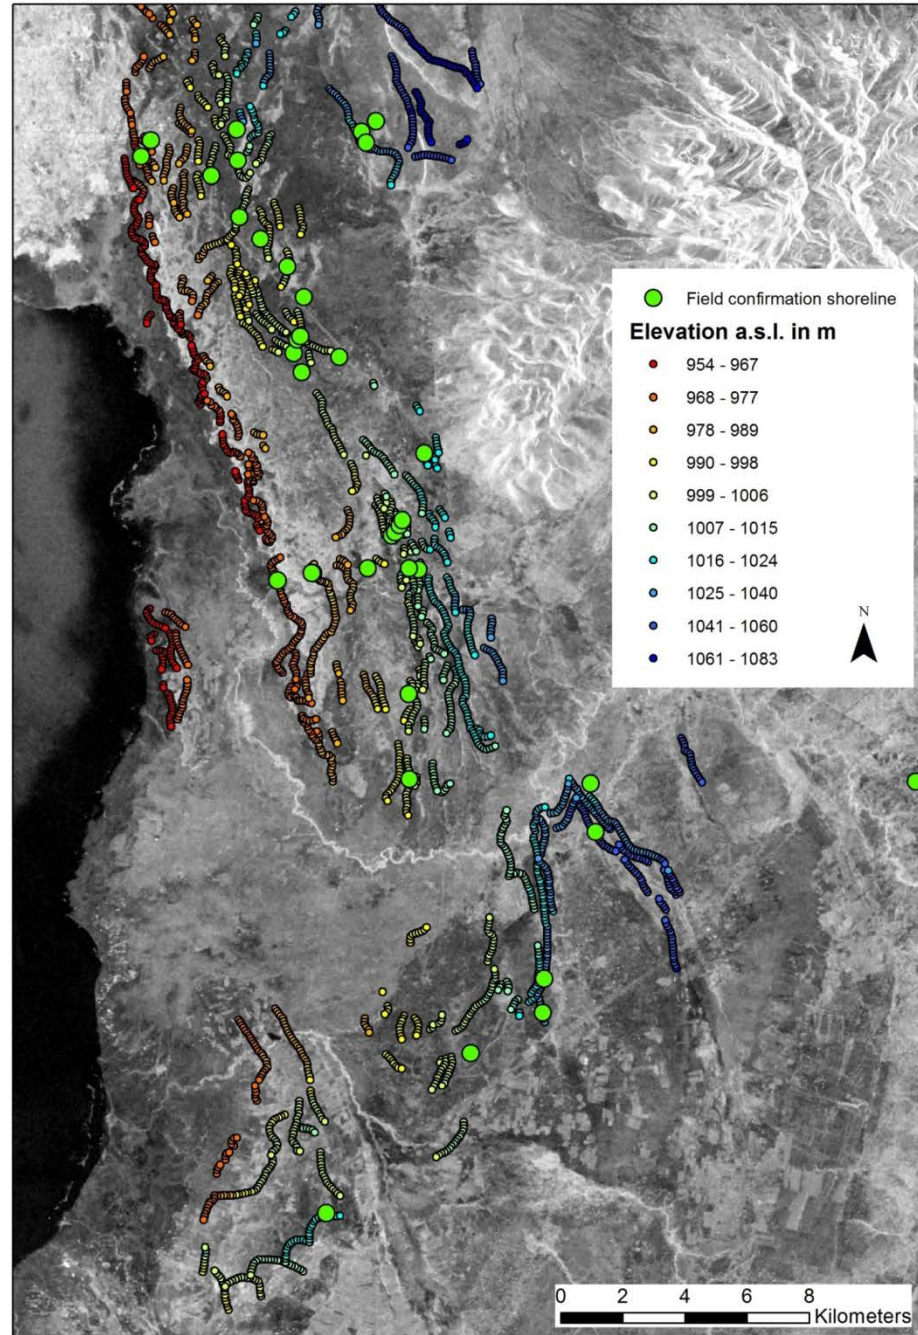

Stromatolites, oncolites and paleo-shoreline

TerraSAR-X StripMap (HH; σ^0) 2011-09-11;
Ascending; right looking

ALOS PALSAR (HH; σ^0) 2008-05-24

Conclusions

- Data integration from DEMs, RS and fieldwork is very useful and leads to additional information for archaeological site distribution and lake extent analysis
- SAR data proved to successfully delineate morphological distinct forms
- Datings of stromatolite samples will be compared with datings from adjacent Lake Natron
- Lake level fluctuations in the Pleistocene can be detected and will be correlated with climate reconstruction analysis from East Africa

Thank you.
